## description

These devices contain four independent 2-input NAND gates. They perform the Boolean functions  $Y = \overline{A \cdot B}$  or  $Y = \overline{A+B}$  in positive logic. The open-collector outputs require pullup resistors to perform correctly. They may be connected to other open-collector outputs to implement active-low wired-OR or active-high wired-AND functions. Open-collector devices are often used to generate higher  $V_{OH}$  levels.

The SN54ALS01 is characterized for operation over the full military temperature range of  $-55^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ . The SN74ALS01 is characterized for operation from  $0^{\circ}\text{C}$  to  $70^{\circ}\text{C}$ .
